

## Elementary Dynamics

### Exercises #6 – Impulse, Momentum, Impact, and Energy for Particle Motion

1. The 51 (kg) block *A* is at rest when the force *F* is applied. The block is noted to slide up the inclined plane under the action of the *F*. In the first 2 seconds, *F* varies linearly from 600 (N) to 800 (N). The coefficient of kinetic friction between the block and plane is  $\mu_K = 0.5$ . Find: a)  $I_{\text{total}}$  the total impulse applied to *A* by all forces over the 2-second interval, and b)  $v$  the velocity of the block after 2 seconds.

Answers: (positive values are up the incline)

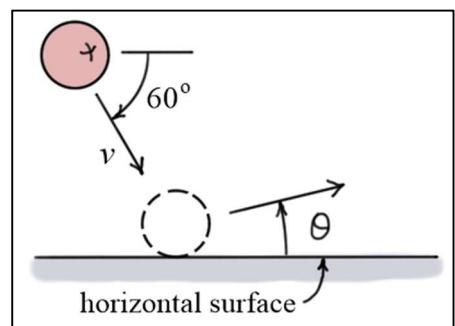

a)  $I_{\text{total}} \approx 466 \text{ (N-s)}$ ; b)  $v \approx 9.15 \text{ (m/s)}$

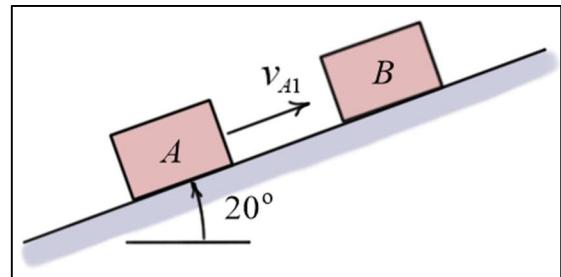

2. A ball of mass  $m = 0.1 \text{ (kg)}$  strikes a **fixed horizontal surface** with a **speed** of  $v = 20 \text{ (m/sec)}$  at an **angle** of 60 (deg). The **coefficient of restitution** for the impact is  $e = 0.5$ . Neglecting friction and the size of the ball, find: a)  $\theta$  the **angle** at which the ball **rebounds** from the surface, and b)  $h_{\text{max}}$  the **maximum height** the ball attains after leaving the surface. Neglect air resistance.

Answers:

a)  $\theta \approx 40.9 \text{ (deg)}$ ; b)  $h_{\text{max}} \approx 3.82 \text{ (m)}$

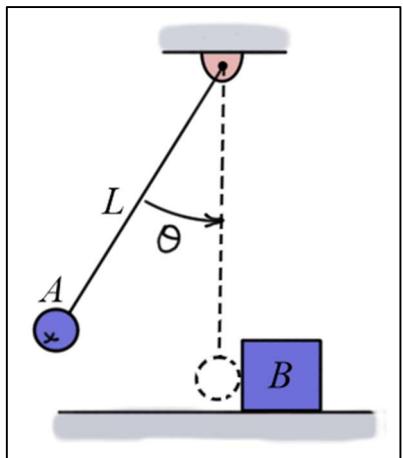

3. At the instant shown, block *B* is at **rest** on the inclined plane. **Just before** impact, block *A* is traveling up the inclined plane at a speed of  $v_{A1} = 30 \text{ (m/s)}$ . The masses of the blocks are  $m_A = 1 \text{ (kg)}$  and  $m_B = 10 \text{ (kg)}$ . Find: a)  $v_{A2}$  and  $v_{B2}$  the velocities of blocks *A* and *B* **just after** the impact, and b)  $\Delta t$  the amount of time it takes block *B* to stop. The coefficient of restitution is  $e = 0.5$ , and the coefficient of kinetic friction is  $\mu_K = 0.4$ . Neglect **non-impulsive** forces during the impact.

Answers: (positive velocities are up the plane, and negative velocities are down the plane)

a)  $v_{A2} \approx -10.9 \text{ (m/s)}$ ,  $v_{B2} \approx 4.09 \text{ (m/s)}$ ; b)  $\Delta t \approx 0.581 \text{ (s)}$

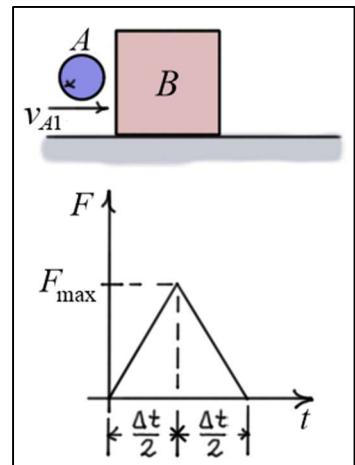

4. The system shown consists of a simple pendulum and a block  $B$  on a horizontal surface. Ball  $A$  and the block  $B$  have masses of  $m_A = 2 \text{ (kg)}$  and  $m_B = 4 \text{ (kg)}$ , and the pendulum has length  $L = 2 \text{ (m)}$ . As the pendulum swings down, the  $A$  strikes  $B$  causing it to slide along the surface. The coefficient of restitution between  $A$  and  $B$  is  $e = 0.7$ , and the kinetic coefficient of friction between the block and plane is  $\mu_k = 0.1$ . Given the pendulum is **released from rest** at  $\theta = 60 \text{ (deg)}$ , find: a)  $v_{A1}$  the velocity of the  $A$  **just before** it contacts the block, b)  $v_{A2}$  and  $v_{B2}$  the velocities of  $A$  and  $B$  **just after** the impact, and c)  $\Delta t$  the time it takes for  $B$  to come to rest.

Answers: (velocities positive to the right)

a)  $v_{A1} \approx 4.43 \text{ (m/s)}$ ; b)  $v_{A2} \approx -0.591 \text{ (m/s)}$ ,  $v_{B2} \approx 2.51 \text{ (m/s)}$ ; c)  $\Delta t \approx 2.56 \text{ (s)}$

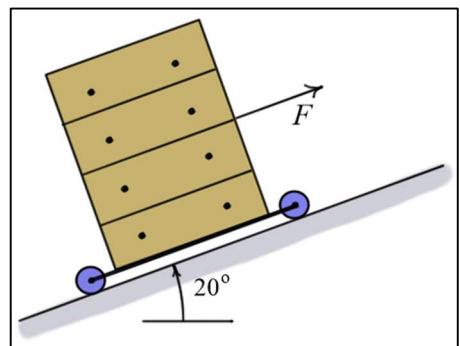

5. Box  $B$  is at **rest** on the **horizontal plane** when it is struck by **ball A** causing it to move to the right. The mass of  $A$  is  $m_A = 1 \text{ (kg)}$ , the mass of  $B$  is  $m_B = 5 \text{ (kg)}$ , the velocity of  $A$  just before it strikes  $B$  is  $v_{A1} = 10 \text{ (m/s)}$ , the coefficient of restitution is  $e = 0.6$ , and the coefficient of kinetic friction between  $B$  and the floor is  $\mu_k = 0.2$ . Find: a)  $v_{B2}$  the velocity of  $B$  just after the impact, and b)  $t_B$  the time it takes for  $B$  to come to rest after the impact. **Neglect non-impulsive** forces during the impact. Then, assuming the impulsive impact force between  $A$  and  $B$  has the form shown, find c)  $F_{\max}$  the **maximum** value of the impact force. Assume  $\Delta t = 0.006 \text{ (sec)}$ .

Answers:

a)  $v_{B2} \approx 2.67 \text{ (m/s)}$ ; b)  $t_B \approx 1.36 \text{ (s)}$ ; c)  $F_{\max} \approx 4.44 \text{ (kN)}$

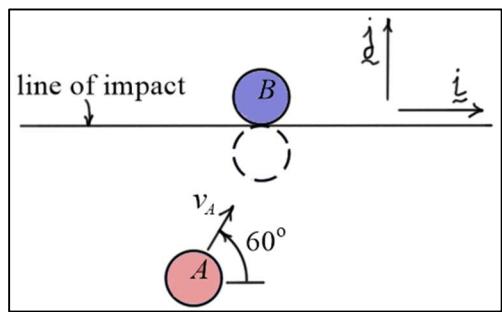

6. The 20 (lb) chest is pulled up the incline by the force  $F(t) = (5+t) \text{ (lb)}$ , where  $t$  is in seconds. Assuming the chest is **released from rest**, when  $F$  is applied find: a)  $I_{\text{total}}$  the total impulse applied to the chest over the time interval  $0 \leq t \leq 5$  seconds, and b)  $v$  the velocity of the chest when  $t = 5 \text{ (s)}$ . Neglect friction.

Answers: (positive values indicate impulse and velocity up the plane)

a)  $I_{\text{total}} \approx 3.30 \text{ (lb-s)}$ ; b)  $v \approx 5.31 \text{ (ft/s)}$

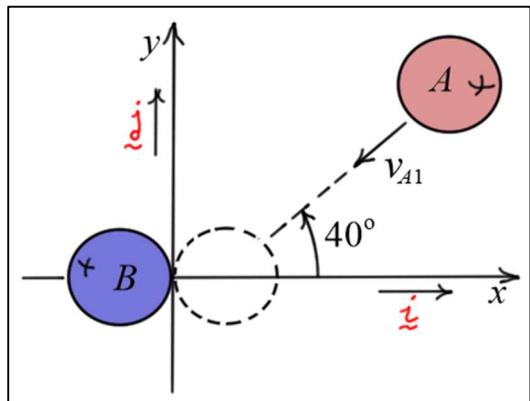

7. Puck  $A$  of mass  $M = 2$  (kg) slides along a **horizontal, frictionless** surface and collides with puck  $B$  of mass  $m = 1$  (kg) as shown. Just **before impact**, puck  $A$  has velocity  $v_A = 5$  (m/s) at the angle shown, and puck  $B$  is at **rest**. The pucks collide so that the line tangent to the impact is along the  $\hat{j}$  direction as shown. The coefficient of restitution  $e = 0.6$ . Neglecting friction and the size of the pucks, find the velocities of  $A$  and  $B$  **just after impact**.

Answers:

$$v_A \approx 2.5 \hat{i} + 2.02 \hat{j} \text{ (m/s)} \quad \text{and} \quad v_B \approx 4.62 \hat{j} \text{ (m/s)}$$

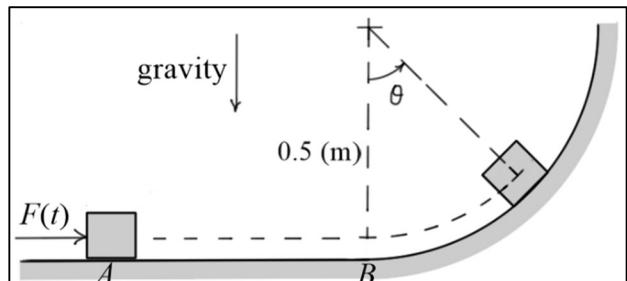

8. The two smooth balls  $A$  and  $B$  each of mass  $m = 0.2$  (kg) are rolling on a horizontal surface.  $B$  is at **rest** when  $A$  strikes it with a velocity  $v_{A1} = 1.5$  (m/s) as shown. The coefficient of restitution is  $e = 0.85$ . **Neglecting friction** and the **size** of the balls, find: a)  $v_A$  and  $v_B$  the velocities of the balls **just after** impact, and b)  $\phi$  the angle that ball  $A$  is moving relative to the positive  $x$  axis just after the impact.

Answers:

$$\text{a) } v_A \approx -0.0862 \hat{i} - 0.964 \hat{j} \text{ (m/s)} \quad \text{and} \quad v_B \approx -1.06 \hat{i} \text{ (m/s)}; \text{ b) } \phi \approx -95.1 \text{ (deg)}$$

9. A 10 (kg) block is at **rest** at  $A$  when it is struck with an impulsive force  $F(t)$ . **Neglecting friction** and the **size** of the block, find  $v$  the velocity of the block at  $t = 0.1$  (sec). Assume  $F(t)$  varies as shown in the diagram with  $F_{\max} = 600$  (N). Does the block stop before reaching the top of the circular track?

Answers:

$$v \approx 3 \text{ (m/s)}$$

Yes, the block reaches a maximum height of 0.459 (m)  $< 0.5$  (m).
